

Greetings from

EL SEGUNDO

California

Two DryCool™ units were purchased by one of America's gourmet popcorn makers, Popcornopolis — who can now create over 20 varieties of popcorn without the worry of compromised quality or flavor. Some of the company's flavors are more sensitive to high humidity levels than others, which can cause problems with the popcorn seasoning adhering consistently and evenly to the popcorn. However, the DryCool™ units are able to replace moist exhaust air in the store's popcorn kettle with dry air to ensure a more uniform product is made.

P.S. The world's largest popcorn ball weighed 3,415 pounds, measured 8 feet in diameter, and had a circumference of 24.6 feet.
